

DESIGN CHALLENGE

What is the problem you're trying to solve?

To prevent people from a wrong choice when they would like to have a pet.

1. Take a stab at framing this challenge as a question:

How might we prevent people from getting an unsuitable breed of an animal for their needs?

2. Now state the key outcome you're trying to achieve:

It is possible for people to pick the right breed of an animal without wasting time, money and energy.

3. Write down important aspects of the context or constraints that you need to consider:

-- An algorithm that will predict the perfect breed of an animal based on the answers that the people give to the questions in the website.

-- It will be time-consuming to familiarize ourselves with every breed of an animal that is on our website.

4. What are some possible solutions to your design question?

A website that will ask the users specific questions and based on the answers, it will predict the best animal breed for the certain user.
